CONCRETE FOOTPATH REPLACEMENT PROGRAM

OVERVIEW

IUS was contracted to install concrete footpaths to replace worn out surfaces for various local authorities throughout Ireland. These works would result in safer walkways for pedestrian access.

DESCRIPTION

IUS have carried out a concrete footpath replacement program in conjunction with the local council. Typically IUS replace c.5,000m² of footpath per annum. All works have been carried out to the exacting standards of the local authorities. This has resulted in repeat orders through out Ireland.

The scope included the breakdown and removal of worn footpaths, replaced with new polished concrete surfaces to council specifications. IUS also regraded verges adjacent to the new footpaths, raised and reinstalled existing street furniture.

Locations of these works varied between heavily populated residential areas, industrial areas, rural areas and busy road sides. IUS managed all traffic control on these projects in conjunction with local councils. All Health & Safety was managed on site by our Project Manager and a team of civils staff. All excess waste material was removed from site in a responsible and environmentally friendly way to meet legislative requirements. All works were completed on time and within budget.
